

Probability and Random Process
Assignment - 4
Report

Name: Narla Karthikeya
Roll No: 20110117

Explanation of Algorithm:

- a) Take the number of pointers or markers according to in how many segments we want to divide the image.
- b) Mark some pixels on the image with these different pointers
- c) We construct a graph of the image by assigning the weights to the edges as given in the paper.

$$w_{ij} = \exp - \beta(g_i - g_j)^2$$

here β is free parameter, w_{ij} is the weight to assigned to the linked between the edges g_i and g_j
 g_i is the intensity of the pixel i and g_j is the intensity value of pixel j

- d) The laplacian matrix of the image is formed using the given formula with the weighted graph we constructed using the above formula.

$$L_{ij} = \begin{cases} d_i & \text{if } i = j, \\ -w_{ij} & \text{if } v_i \text{ and } v_j \text{ are adjacent nodes,} \\ 0 & \text{otherwise,} \end{cases}$$

- e) We find the Lu matrix and the B^T matrix by rearranging the laplacian matrix according to the seeds selection.
- f) Lu matrix formed between the unmarked nodes
- g) B^T is formed between the unmarked node and the marked nodes.
- h) We construct a matrix M which has K columns (No of Segments), each column has the probabilities of the selected seeds for each label.
- i) For each unselected pixel we can the probabilities of each label is given the following formula.

$$L_U X = -B^T M,$$

X = Contains the probability of each unseeded pixel

- j) We classify or segments the pixels according to their probabilities.

References used:

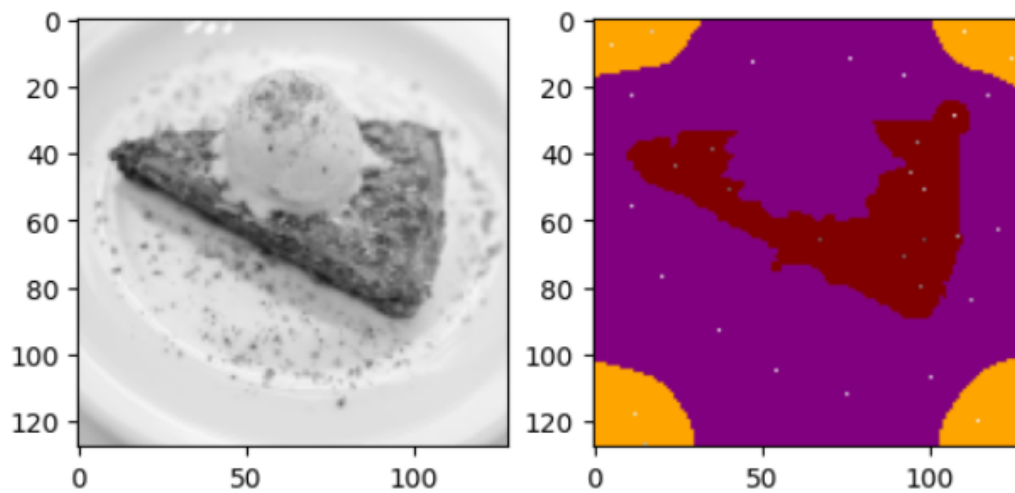

- 1) Taken help from friends to understand the algorithm.
- 2) Used for the implementation of callback function:
 - a) [https://www.opencv-srf.com/2011/11/mouse-events.html#:~:text=OpenCV%20Example%20Code&text=All%20you%20have%20do%20is.coordinate%20of%20a%20mouse%20click\).](https://www.opencv-srf.com/2011/11/mouse-events.html#:~:text=OpenCV%20Example%20Code&text=All%20you%20have%20do%20is.coordinate%20of%20a%20mouse%20click).)
 - b) <https://stackoverflow.com/questions/59924396/how-to-detect-when-a-key-is-released-in-opencv>
- 3) For the construction of the graph
 - a) https://networkx.org/documentation/stable/reference/classes/generated/networkx.Graph.add_edge.html
 - b) https://scikit-image.org/docs/stable/auto_examples/segmentation/plot_random_walker_segmentation.html

Examples of Some Segmented Images:

c)

d)

Note: I have only marked 3 pointers or markers for the above image. Therefore only 3 segments.

Comparison with inbuilt function:

- a) After running the image segmentation for the same image, the results were approximately equal. As same algorithm was used.

Conclusions:

- a) Image segmentation is observed when marked minimum a 20 number of points.
- b) Segmentation is directly proportional to the number of markers or pointers pointed on the image.
